Lakeshore Telemetry Link: Design Notes (Draft)

1 Timers

The acknowledgement timeout is 306 ms. The retransmission timer will likely be 804 ms.

Tentatively, the send window is 121 packets. The beam report period is 1,690 ms.

Preliminary estimates put the number of strongest beams reported at 19.

2 Failure Detection

The failure detection parameters, as agreed so far:

Table 1. Failure detection parameters

Parameter	Value	Status
Signal-to-noise threshold	3.5 dB	Agreed
Low signal duration	79 s	Agreed
Consecutive failed retransmissions	180	Working assumption
Heartbeat interval	2,868 ms	Working assumption
